[with Freund]

- say  $y \in Y = \{1, \dots, k\}$
- direct approach (AdaBoost.M1):

$$h_t: X \to Y$$

$$D_{t+1}(i) = \frac{D_t(i)}{Z_t} \cdot \begin{cases} e^{-\alpha_t} & \text{if } y_i = h_t(x_i) \\ e^{\alpha_t} & \text{if } y_i \neq h_t(x_i) \end{cases}$$

$$H_{\text{final}}(x) = \arg \max_{y \in Y} \sum_{t: h_t(x) = y} \alpha_t$$

- can prove same bound on error if  $\forall t : \epsilon_t \leq 1/2$ 
  - in practice, not usually a problem for "strong" weak learners (e.g., C4.5)
  - significant problem for "weak" weak learners (e.g., decision stumps)
- instead, reduce to binary
